#### Introduction

Sport and athletics date back to the earliest written recordings of man's history (Figure 2.1) as does the knowledge of athletic injuries and their care. Writings describing sports injury date back to the book of Genesis 32, and writings describing the use of exercise in a therapeutic manner in the provision of health care for an injured athlete date back to the writings of the Hindu and Chinese around 1000 BC. Throughout the ages, our knowledge and ability to prevent, diagnose, and care for athletic injury and illness have continued to progress. With progress, multiple disciplines of professionals have developed specific bodies of knowledge and expertise aimed at improving our ability to prevent and provide the most appropriate care for the injured athlete. "Sports medicine" is the broad collective term that we utilize today to describe the body of knowledge and application of this knowledge to the injured athlete. While the use of the term "medicine" most often signifies the physicians' contribution, history will show us that much of the care provided to the injured athlete has been rendered not only by physicians but also by a multitude of other professionals.

챕터 별로 이동 가능

and "sports therapy"

Using Merriam-webster Dictionary as a foundation, "sports medicine" may be best defined as the art and science dealing with the maintenance of health and the prevention, alleviation, or cure of disease or injury in the athlete. It includes the study of the management of musculoskeletal injuries and the medical problems encountered by athletes during training and competition and training. Sports medicine also encompasses the study of the physiological and mental change and nutritional requirements placed upon individuals involved in strenuous athletic activity, injury prevention and conditioning strategies, and the rehabilitative process, or "sports therapies" necessary to prevent injury and return athletes to a safe competitive level. "Sports therapy" may be best defined as the art and science of the application of remedial agents or methods to prevent injury and return an injured or ill athlete back to a state of optimal physical condition to return to sport. "Sports medicine" and "sports therapy" incorporate the expertise of exercise physiologists, nutritionists, physical therapists, athletic trainers, massage therapists,

CHAPTER 30

## Sports Medicine in the Growing Child

Mininder S. Kocher  
Theodore J. Ganley

### ORTHOPAEDIC CARE OF THE YOUNG ATHLETE

**Risks of Injury during Sports Participation.** It is estimated that approximately 30 million children and youth in the United States between the ages of 6 and 21 years engage in sports programs that are held by approximately 7.2 million participate in high-school sports programs (1). This participation in sports has long been an integral part of American childhood culture with numerous benefits including physical fitness, exercise, and development of teamwork skills for these kids.

To know if the benefits of the sports activities warrant the risks involved, so an understanding of sports-specific risks is crucial to provide a comprehensive approach to address this

Balance studies of each sport, specific risks and patterns of injury associated with each sport are determined and compared. From these data, it may be possible to develop specific interventions designed to reduce the frequency of injuries.

**Epidemiology of Athletic Injuries in Children.** What do we know about sports injuries in children and youth?

There are sports-specific data that identify the risk of injury to participants for most sports (2,3,4). The most comprehensive statistics on children's recreational injuries are available from the United States Consumer Product Safety Commission (CPSC). The CPSC operates the National Electronic Injury Surveillance System (NEISS) whereby data are gathered from the emergency departments of 100 hospitals throughout the United States. These data are then used in conjunction with other models involving the relation between emergency room visits and the number of injuries treated outside hospital emergency rooms to arrive at an estimate of the number of injuries treated for each specific age group in hospital emergency rooms, doctor's offices, clinics, and ambulatory centers. The figures for children and youth in 2017 reveal that injuries occurred most frequently in basketball, followed by football, soccer, and baseball, and that over 3.2 million children under age 14 required medical attention for injuries (2) (Table 30-1).

An additional source of sports-specific data for highschool athletes is available through a recent systematic review and meta-analysis of anterior cruciate ligament (ACL) tear injuries. Information was collected for eight sports including basketball, field hockey, football, lacrosse, soccer, softball/baseball, volleyball, and

### ORTHOPAEDIC CARE OF THE YOUNG ATHLETE

**Risks of Injury during Sports Participation.** It is estimated that approximately 30 million children and youth in the United States between the ages of 6 and 21 years engage in sports programs that are held outside of school and 7.2 million participate in high-school sports programs (1). This participation in organized activities has long been an integral part of American childhood culture with numerous benefits including camaraderie, exercise, and development of teamwork skills for these kids.

However, parents want to know if the benefits of the sports activities warrant the risks involved, so an understanding of sports-specific risks is crucial to provide a comprehensive approach to address this concern.

With appropriate surveillance studies of each sport, specific risks and patterns of injury associated with different sports can be determined and compared. From these data, it may be possible to develop specific
